ABSTRACT

By using KVL - KIRCHHOFF'S VOLTAGE LAW finding the voltage at each node of the circuit.

Source code:

```
#include <stdio.h>
#include <stdlib.h>
#define MAX NODES 10
void apply kvl(int num nodes, int adjacency matrix[MAX NODES][MAX NODES], int num sources, int
current sources[MAX NODES][3])
       double voltages[MAX NODES] = \{0\};
       // Applying KVL to find voltages
       for (int iter = 0; iter < num nodes; iter++)
               for (int i = 0; i < num nodes; i++)
               {
                      for (int j = 0; j < num nodes; j++)
                             if (i!=j)
                                     voltages[i] += voltages[i] - (adjacency matrix[i][j] * voltages[i]);
                      }
              // Incorporate current sources
              for (int i = 0; i < num sources; i++)
                     voltages[current sources[i][1]] -= current sources[i][2];
                      voltages[current_sources[i][0]] += current_sources[i][2];
       }
       // Print voltages
       for (int i = 0; i < num nodes; i++)
              printf("Voltage at Node %d: %.21f V\n", i + 1, voltages[i]);
int main()
       int num nodes = 4;

OUTPUT

REPORT

This experiment effectively implemented Kirchhoff's Voltage Law using C programming. The calculated node voltages validate the theoretical principles of KVL and showcase the utility of computational methods in circuit analysis.

CONCLUSION

In conclusion, the C code successfully implements Kirchhoff's Voltage Law (KVL) to determine node voltages in an electrical circuit. The algorithm iteratively applies KVL principles, considering both the circuit's topology, represented by an adjacency matrix, and the influence of current sources.
